Mr. Sidney Char
American Institute of Architects
Honolulu Chapter
119 Merchant Street, Suite 402
Honolulu, Hawaii 96813

Dear Mr. Char:

Subject: Honolulu High-Capacity Transit Corridor Project
Comments Received on the Draft Environmental Impact Statement

The U.S. Department of Transportation Federal Transit Administration (FTA) and the City and County of Honolulu Department of Transportation Services (DTS) issued a Draft Environmental Impact Statement (EIS) for the Honolulu High-Capacity Transit Corridor Project. This letter is in response to substantive comments received on the Draft EIS during the comment period, which concluded on February 6, 2009. The Final EIS identifies the Airport Alternative as the Project and is the focus of this document. The selection of the Airport Alternative as the Preferred Alternative was made by the City to comply with the National Environmental Policy Act (NEPA) regulations that state that the Final EIS shall identify the Preferred Alternative (23 CFR § 771.125 (a)(1)). This selection was based on consideration of the benefits of each alternative studied in the Draft EIS, public and agency comments on the Draft EIS, and City Council action under Resolution 08-261 identifying the Airport Alternative as the Project to be the focus of the Final EIS. The selection is described in Chapter 2 of the Final EIS. The Final EIS also includes additional information and analyses, as well as minor revisions to the Project that were made to address comments received from agencies and the public on the Draft EIS. The following paragraphs address comments regarding the above-referenced submittal:

VISUAL IMPACTS

The island's unique visual character and scenic beauty was considered in the visual and aesthetic assessment presented in the Draft and Final EISs. It is acknowledged that the guideway and stations will noticeably contrast with Chinatown's historic character. In

Formatted: Indent: First line: 0.5"

addition, views in Downtown and the other areas, including protected mauka-makai views, will be blocked and some views will change, resulting in substantial visual effects. Section 4.8 of the Final EIS further assesses protected mauka-makai views from what was presented in the Draft EIS (see Tables 4-10 through 4-14 and Figures 4-39 through 4-50). The assessment acknowledges that some view obstructions and changes to views will be unavoidable and substantial. They will be most noticeable where the guideway and stations are nearby or in the foreground of views. This includes views for those who travel near the alignment. The degree of visual effect will vary with the alignment orientation, guideway and station height, and height of surrounding buildings and trees, along with the viewer's expectations of view quality. It is also noted that the Project will conflict with Revised Ordinance of Honolulu (ROH) Section 24-1.4 where project elements, such as the guideway, will block protected mauka-makai view corridors. View changes are not likely to be obtrusive in wider vistas or regional panoramic views where the project elements serve as smaller components of the larger landscape. Section 4.8.3 of the Final EIS includes more detail on measures that will minimize and mitigate negative visual effects.

Project Goals and Objectives

The Project will have a positive effect on community, social, economic, and natural resources in a number of ways. With a net reduction of more than 40,000 cars a day taken off Oahu's crowded highways, the Project will provide a transportation benefit to the community as a whole—even to those who never use the system. The high-quality transit access will serve major transit-dependent communities in Honolulu linking jobs with affordable housing and will help focus future growth into existing and planned urban areas. The City is working with communities to plan the areas around stations to attract high quality mixed-use development that will create opportunities for affordable housing and accessible jobs in an environment well suited to walking, bicycling, and transit use. This will expand economic and social opportunities to those without access to a car and allow families to save money otherwise budgeted for transportation.

~~The Project has logical termini at East Kapolei and Ala Moana Center and independent utility from any extensions that may be constructed in the future. The future extensions to West Kapolei, Salt Lake Boulevard, Waikiki, and UH Manoa are discussed in the cumulative impacts sections of Chapters 3 and 4 of the Final EIS. However, the future extensions are not part of this Project, thus, they are not required to be evaluated under Chapter 343 of the Hawaii Revised Statutes NEPA. Under NEPA, environmental analysis is only required when there is a proposed action by a Federal agency. Here, because the future extensions are not proposed for implementation at this time, they are not part of the Project studied in the Final EIS. It would be premature to undertake an environmental analysis of the extensions (beyond the cumulative impacts analysis) because they are not part of the proposed action to be taken by the City and FTA. If the future extensions are proposed for implementation in the future, environmental analysis of the extensions and appropriate alternatives will be undertaken at that time. In response to your second comment,~~

Safety and Security-Section 4.6.3 of the Final EIS describes potential safety and security issues that may arise once the Project is operating. The discussion notes that to

Comment [k1]: Give a summary of these.

Formatted: Font: Bold

Comment [k2]: Further address the comment about community planning in the response. Has anything been added to the FEIS on community benefits?

Comment [k3]: The transit service will still cost money.

Comment [k4]: This does not address any comment made by Char

Formatted: Font: Bold

reduce the potential for crime, the FTA requires the development and implementation of a Safety and Security Management Plan (SSMP) for new fixed guideway projects (49 CFR 633). The SSMP will address the technical and management strategies for analyzing safety or determining security risks throughout the Project's life cycle. In addition, DTS has developed specifications and Design Criteria to address the City and County of Honolulu's requirements for the Project. Chapter 25 of the Design Criteria is dedicated to the safety and security of the system.

Visual Impacts: The Alternatives Screening Memorandum (DTS 2006a) recognized the visually sensitive areas in Kakaako and Downtown Honolulu, including the Chinatown, Hawaii Capital, and Thomas Square/Academy of Arts Special Design Districts. To minimize impacts on historic resources, visual aesthetics, and surface traffic, the screening process considered 15 different combinations of tunnel, at-grade, or elevated alignments between Iwilei and Ward Avenue. Five different alignments through Downtown Honolulu were advanced for further analysis in the Alternatives Analysis, including an at-grade portion along Hotel Street, a tunnel under King Street, and elevated guideways along Nimitz Highway and Queen Street.

Alternatives Considered

The Alternatives Analysis Report (DTS 2006b) evaluated the alignment alternatives based on transportation and overall benefits, environmental and social impacts, and cost considerations. The report found that an at-grade alignment along Hotel Street would require the acquisition of more parcels and affect more burials than any of the other alternatives considered. The alignment with at-grade operation Downtown and a tunnel through the Capital Historic District, was not selected because of the identified in addition to the environmental effects, such as impacts to cultural resources, reduction of street capacity, and property acquisition requirements of the at-grade and tunnel sections, would cost more than \$300 million more than the least expensive alternative.

The Project's purpose is "to provide high-capacity rapid transit" in the congested east-west travel corridor. The need for the Project includes improving corridor transit mobility and reliability. The at-grade alignment would not meet the Project's Purpose and Need because it could not satisfy the mobility and reliability objectives of the Project. Some of the technical considerations associated with an at-grade versus elevated alignment through Downtown Honolulu include the following:

System Capacity, Speed, and Reliability—The short, 200-foot (or less) blocks (or less) in Downtown Honolulu would permanently limit the system to two-car trains to prevent stopped trains from blocking vehicular traffic on cross-streets. Under ideal operational circumstances, the capacity of an at-grade system could reach 4,000 passengers per hour per direction, assuming optimistic five minute headways. Based on travel forecasts, the Project should support will need to carry approximately 8,000 passengers by 2030. Moreover, the system can be readily expanded to carry over 25,000 in each direction by reducing the interval between trains (headway) to 90 seconds during the peak period. To reach preserve a comparable system capacity, speed, and reliability, an at-grade alignment would require a fenced, segregated right-of-way that would eliminate all obstacles to the train's passage, such as vehicular, pedestrian, or bicycle crossings. Even with transit signal priority, the at-grade

Comment [k5]: This is not correct. This is final guidance found in a Federal Register Circular from June 21, 2007 for projects under 49 CFR part 633. It needs to be correctly referenced.

Comment [k6]: Of what document?

Comment [k7]: This does not respond to the commenter's concern about "undesirable environments under the elevated guideway areas"

Formatted: Font: Bold

Formatted: Indent: First line: 0.5"

Formatted: Font: Bold

Formatted: Font: Bold

Formatted: Font: Bold

Comment [k8]: Is this the same tunnel referenced in the previous paragraph? Use the same name for referencing

Comment [k9]: The cost should be compared to the selected alternative, not the least expensive alternative and perhaps this point should be removed if cost efficiency cannot be justified

Comment [k10]: This sentence is unclear. If we are stating that alternatives were not selected then we need to specify all of the reasons why, which could be controversial. Cost and traffic impacts are not environmental impacts.

Comment [k11]: Why? Please expand/explain this statement

Comment [k12]: What system? At grade or Project?

speeds would be slower and less reliable than an elevated guideway. An at-grade system would travel at slower speeds due to the shorter blocks, tight and short radius curves in places within the constrained and congested Downtown street network, the need to obey traffic regulations (e.g., traffic signals) along with other vehicles, and potential conflicts with other at-grade activity, includingsuch as cars, bicyclists, and pedestrians. These effects result in mean longer travel times and decreased far less reliability than a fully grade-separated system. None of these factors affect an elevated rail system. The elevated rail can travel at its own speed any time of the day regardless of weather, traffic, or the need to let cross traffic proceed at intersections.

Mixed-Traffic Conflicts—With the planned three-minute headways, the short cycle of traffic lights would affect traffic flow and capacity of cross-streets. Furthermore, there would be no option to increase the capacity of the system by reducing the headway to 90 seconds. An at-grade system would also require removal of two or more existing traffic lanes on affected streets. This effect is significant and would exacerbate congestion for those who choose to drive. Congestion would not be isolated to the streets that cross the at-grade alignment but instead would spread throughout Downtown. The Final EIS shows that the Project's impact on traffic will be isolated and minimal, and in fact will reduce system-wide traffic delay by 18 percent compared to the No Build Alternative (Table 3-14 in the Final EIS). That is because the elevated guideway will require no removal of existing travel lanes, while providing an attractive, reliable travel alternative. When traffic slows, or even stops due to congestion or incidents, the elevated rail transit will continue to operate without delay or interruption.

AnThe at-grade light rail, with its continuous tracks in-street, wouldwill create major impediments to turning movements, many of which would have to be closed to eliminate a serious crash hazard. Even where turning movements are designed to be accommodated, at-grade systems experience significant collision problems. In addition, mixing at-grade fixed guideway vehicles with cars, bicyclists, and pedestrians presents a much higher potential for conflicts compared to grade-separated conditions. Where pedestrian and automobiles cross the tracks in the street network, particularly in areas of high activity (e.g., station areas or intersections), there is a risk of collisions involving trains that does not exist with an elevated system. There is evidence of crashes between trains and cars and trains and pedestrians on other at-grade systems throughout the country. This potential would be especially high in the Chinatown and Downtown neighborhoods, where the number of pedestrians is very high and the aging population presents a particular risk.

Construction Impacts—Constructing an at-grade rail system could have more effects than an elevated system in a number of ways. The wider and continuous footprint of an at-grade rail system compared to an elevated rail system (which touches the ground only at discrete column foundations, power substations, and station accessways) increases the potential of utility conflicts and impacts to discovery of sensitive cultural resources. In addition, the extra roadway lanes taken utilized by an at-grade away for the system would result in increased congestion or require that additional businesses or homes be taken to widen the roadway through Downtown. Additionally, the duration of short-term construction impacts to the community and environment with an at-grade system would be considerably greater than with an elevated system. Because of differing construction techniques, more lanes would need to be

Comment [k13]: Are there other notable impacts of an at-grade system that can be summarized? Noise and vibration?

Comment [k14]: Reword this to "signal interruption for travel times where signal priority doesn't exist"

Comment [k15]: Reword these sentences. Confusing.

Comment [k16]: How can something be closed that is theoretical/has not been constructed?

Comment [k17]: See previous comment. Language should reflect that this is a theoretical system.

continuously closed for at-grade construction and the closures would last longer than with elevated construction. This would result in a greater disruption to business and residential access, prolonged exposure to construction noise, and traffic impacts.

Because it is not feasible for an at-grade system through Downtown to move passengers rapidly and reliably without significant detrimental effects on other transportation system elements (e.g., the highway and pedestrian systems, safety, reliability, etc.), an at-grade system would have a negative system-wide impact that would reduce ridership throughout the system. The at-grade system would not meet the Project's Purpose and Need and, therefore, does not require additional analysis.

Cost effectiveness

The resources and costs associated with construction and operation on a lifecycle scale of an elevated system have been considered in project planning. As evaluated in the Alternatives Analysis, an underground system would be the least cost-effective option. An at-grade system in the Downtown area would not meet project requirements for rapid, safe, and reliable operations. The system will be constructed and operated in a sustainable manner using best practices and will result in a reduction in total energy demand on the island.

Rail Technology

~~In response to your final comment, t~~The Project's chosen technology ensures speed, reliability, and efficiency and is the only one that allows an automated, driverless system. As such, it will have a lower operating cost and support attract the highest ridership of all technologies examined. As discussed previously, at-grade operation would require a fenced right-of-way with no crossings, which is not possible to construct in the Downtown area.

The FTA and DTS appreciate your interest in the Project. The Final EIS, a copy of which is included in the enclosed DVD, has been issued in conjunction with the distribution of this letter. Issuance of the Record of Decision under NEPA and acceptance of the Final EIS by the Governor of the State of Hawaii are the next anticipated actions and will conclude the environmental review process for this Project.

Very truly yours,

WAYNE Y. YOSHIOKA
Director

Enclosure

Comment [k18]: This paragraph does not adequately address the comment. What were the findings of the AA? Also, this does not address electrical consumption and the 7x more energy comment. Need to add more explanation of why the preferred alternative is cost effective. Discuss sustainable transit design. Doesn't address the overhead lines recommendation.

Formatted: Font: Bold

Formatted: Indent: First line: 0"

Comment [k19]: This response needs to expand upon why this technology is preferable. Additional information is needed here to support this claim. The overhead lines recommendation is not addressed.
